

SafaWala CRM

UX / UI Audit Report

User Experience · Interface Quality · Flow Analysis

Audit Type	UX / UI — User Perspective (Code-Based Deep Review)
Date	June 4, 2026
Pages Reviewed	50+ pages & components, incl. every major user flow
Method	Full source code analysis — forms, states, navigation, flows
Total UX Issues	32 issues across 11 screens & flows
Overall UX Score	62 / 100 — Needs Focused UX Improvements

1. What This Audit Covers

This audit reviews the SafaWala CRM **purely from a user's point of view** — how the interface feels, what confuses people, where flows break, and what frustrates daily users like franchise owners, booking staff, and delivery team. Every finding is based on reading the actual page and component source code.

Screen / Flow	Issues Found	Score
Login Page	2	75/100
Dashboard	4	65/100
Bookings List	5	60/100
Create / New Booking Form	7	50/100
Customers	2	75/100
Deliveries & Returns	4	60/100
Invoices	2	70/100
Reports	2	65/100
Settings	1	75/100
Navigation / Global	3	60/100

2. Login Page

#1 Login Page Has Demo Credentials Pre-filled		CRITICAL
■ Login Page · app/page.tsx lines 16-17		
What user sees	When a user opens the login page, the email field is pre-filled with 'admin@safawala.com' and the password with 'admin123'. Any person who opens the URL sees this.	
Why it's a problem	This is a major security & trust problem. Staff/franchise owners who see pre-filled demo credentials lose trust. If a customer or outsider accidentally visits the URL, they know the demo credentials. It also confuses staff — they may try logging in with demo creds instead of their own.	
Recommended fix	Remove the pre-filled values on the root login page (app/page.tsx lines 16-17). The /auth/login page correctly has empty fields. Make root page redirect to /auth/login or unify to a single login page with empty fields.	

#2 No 'Forgot Password' Link on Login Screen		HIGH
■ Login Page · app/page.tsx & app/auth/login/page.tsx		
What user sees	The login form has Email and Password fields + Sign In button. There is no 'Forgot password?' or 'Reset password' link anywhere on either login page.	
Why it's a problem	When a staff member or franchise admin forgets their password, they have no self-service recovery path. They must contact a super admin to reset manually — blocking them from work.	
Recommended fix	Add a 'Forgot password?' link below the password field. Wire it to Supabase's built-in resetPasswordForEmail() function. This is a one-afternoon feature and removes significant friction for all users.	

3. Dashboard

#3 Dashboard Shows Blank Screen Until Auth Check Completes

HIGH

■ Dashboard · app/dashboard/page.tsx line 217

What user sees	When the dashboard loads, the code does `if (!user) return null`. This means the entire page renders nothing — a completely blank white screen — while the auth check is running (typically 300–800ms).
Why it's a problem	Users see a jarring flash of nothing before content appears. On slow connections this blank screen can last 2+ seconds, making the app feel broken or crashed. The DashboardSkeleton component exists but is only used AFTER auth passes.
Recommended fix	Replace `if (!user) return null` with the DashboardSkeleton so users see a layout immediately. The skeleton should render even before auth resolves — it shows the user 'content is loading' rather than 'did the app crash?'

#4 Dashboard Stats Show 0 Briefly Before Real Data Loads

HIGH

■ Dashboard · app/dashboard/page.tsx lines 264–299

What user sees	The stat cards render immediately with values like ■0, 0 bookings, 0 customers while the real data is fetching. The skeleton only shows after the full isLoading state is computed, but stats load slightly later than the user state.
Why it's a problem	Users see 0 for every metric, then numbers suddenly change. This is disorienting — franchise owners may think their data was wiped. It also creates a 'pop-in' effect that looks like a bug.
Recommended fix	Show StatCardSkeleton cards (already built) for the stats section until stats data arrives. Or use `stats?.totalRevenue ?? undefined` and show '—' instead of '0' while loading.

#5 Dashboard Search Bar Navigates Away Instead of Searching In Place

MEDIUM

■ Dashboard · app/dashboard/page.tsx lines 194–200

What user sees	The search bar on the dashboard header takes the user to /bookings?search=... on Enter press. There is no visual indicator that pressing Enter will navigate away.
Why it's a problem	Staff expect to search and see results below (or in a dropdown). Instead they are silently taken to a completely different page. No tooltip, no placeholder text saying 'Go to bookings', no chevron arrow — nothing.
Recommended fix	Either: (A) add placeholder text 'Search bookings →' and a right-arrow icon to indicate navigation, or (B) add an instant search dropdown showing top 5 matching bookings inline.

#6 Refresh Button Has No Label — Icon-Only with No Tooltip		LOW
■ Dashboard · app/dashboard/page.tsx line 232		
What user sees	The refresh button in the header shows only a spinning arrow icon (RefreshCw). No text label, no tooltip. When data is loading it spins, but when idle it looks like just a decorative icon.	
Why it's a problem	New staff don't know this button exists or what it does. There's no visual feedback when the refresh completes (other than spinner stopping).	
Recommended fix	Add a tooltip with 'Refresh dashboard data' on hover. Show a brief 'Updated just now' text below stats after refresh completes.	

4. Bookings List Page

#7 Filter Controls Require Clicking 'Apply' — Filters Don't Live-Update

HIGH

■ Bookings · app/bookings/page.tsx lines 77–92

What user sees	There are 5 filter dropdowns (Status, Type, Products, Safa Quantity, Distance). Changing any dropdown does NOT immediately filter the table — it only stages the filter. Users must click a separate 'Apply' button to see results. Most filter UIs in modern apps apply instantly.
Why it's a problem	Staff change a filter and see no change — they think the filter didn't work. They click Apply, sometimes twice. The extra click is unnecessary friction for daily users who filter dozens of times per day.
Recommended fix	Remove the two-step pending/apply filter pattern. Wire all filter dropdowns to directly call <code>setStatusFilter()</code> , <code>setTypeFilter()</code> etc. The 'Apply' and 'Reset' buttons can remain for the 'apply all at once' UX, but at minimum add a live-preview count badge showing '12 results' next to Apply.

#8 Multiple Confusing Routes for Creating a Booking

HIGH

■ Bookings · Sidebar + Multiple Pages

What user sees	There are at least 5 different routes that can create or relate to bookings: <code>/create-invoice</code> , <code>/bookings/new</code> , <code>/book-package</code> , <code>/bookings/create</code> , <code>/bookings/add</code> . The sidebar 'New Booking' link goes to <code>/create-invoice</code> . The bookings page 'New Booking' button also goes to <code>/create-invoice</code> . But <code>/bookings/new</code> , <code>/bookings/add</code> , and <code>/bookings/create</code> also exist.
Why it's a problem	Staff get confused about which route to use. If they land on <code>/bookings/new</code> vs <code>/create-invoice</code> they may see a different version of the form. Search engines and deep links are inconsistent. The codebase has 4,318 lines in <code>bookings/new</code> vs 4,124 in <code>create-invoice</code> — both appear to be actively maintained duplicate pages.
Recommended fix	Decide on ONE canonical booking creation URL (<code>/create-invoice</code> appears to be the active one). Add permanent redirects from all other paths to that single URL. Delete or archive the duplicate pages to prevent maintenance drift.

#9 Table Has No Horizontal Scroll on Mobile — Content Clips

HIGH

■ Bookings · components/bookings/bookings-tabs.tsx line 149

What user sees	The bookings table uses a custom CSS grid layout (<code>grid-cols-12</code>) instead of a standard HTML table with <code>overflow-x-auto</code> . On screens smaller than 1024px (lg breakpoint), the table header is hidden and rows switch to a stacked mobile layout. However on medium screens (768px–1024px) like tablets, columns overlap and text clips.
Why it's a problem	On iPads and smaller laptops (very common for on-the-go staff), the bookings table is unreadable — booking numbers, customer names and amounts overlap. Staff who use a tablet to manage bookings during events will have a terrible experience.
Recommended fix	Wrap the table container in <code>``</code> . Set minimum column widths. Or switch the 768px–1024px breakpoint to also use the stacked layout. Test on 768px and 1024px viewport widths specifically.

#10 Header Action Buttons Overflow Off-Screen on Mobile

HIGH

■ Bookings · app/bookings/page.tsx lines 1135–1149

What user sees	The page header contains 5 buttons in a row: Manage Offers, Refresh, CSV, PDF, New Booking. These are in a flex row with `space-x-2` and NO overflow handling or responsive collapsing. On a phone screen (375px wide), these buttons extend off the right edge of the screen.
Why it's a problem	Staff who manage bookings on mobile cannot access the 'New Booking' and 'Refresh' buttons because they are off-screen. CSV/PDF export is also inaccessible.
Recommended fix	Move secondary actions (CSV, PDF, Refresh) into a dropdown menu (■ More). Keep only 'New Booking' as a primary visible button. Use responsive breakpoints: full buttons on lg+, icon+label on md, icon-only on sm.

#11 WhatsApp Send Invoice Has No Visual Feedback If It Fails

MEDIUM

■ Bookings · app/bookings/new/page.tsx lines 1917–1920

What user sees	After creating a booking, the app fires the WhatsApp invoice send as 'fire and forget'. If the send SUCCEEDS, a small toast shows 'Invoice sent on WhatsApp!'. But if it FAILS (WATI error, wrong phone, network issue), there is complete silence — no toast, no indication, no way to retry from the UI.
Why it's a problem	Staff assume the customer received the WhatsApp invoice but they didn't. The customer shows up to collect without knowing the amount. Staff have no way to manually retry sending from the bookings list.
Recommended fix	On failure, show a toast: 'WhatsApp send failed — tap to retry'. Add a 'Send Invoice' button on the booking row in the bookings list so staff can resend anytime. Show a WhatsApp status icon (✓ sent / ✗ failed) on each booking row.

5. Create / New Booking Form

#12 Form Allows Saving a Booking With No Event Date

CRITICAL

■ Create Booking · app/bookings/new/page.tsx lines 1596–1611

What user sees	The handleCreateOrder() function only validates that a customer is selected. All other fields — event date, delivery date, return date, groom/bride name — are optional. The code even has a comment: 'Products/packages are now optional.' A booking with no event date defaults to today's date silently.
Why it's a problem	Staff can accidentally save incomplete bookings. A booking without an event date appears on today in the calendar view, causing confusion. Bookings without delivery dates won't show up in delivery reminders. Data quality degrades and reporting becomes inaccurate.
Recommended fix	Add validation before save: event_date is required for rental bookings. Highlight the empty required field with a red border instead of just a toast at the top. The 'Create Order' button should be visually disabled (grey + tooltip) until minimum fields are filled.

#13 Form Is 4,318 Lines Long — Overwhelming for New Staff

HIGH

■ Create Booking · app/bookings/new/page.tsx

What user sees	The entire booking creation, editing, quote management, PDF generation, WhatsApp send, and package selection logic is crammed into a single 4,318 line page. From the user's perspective: the form shows ALL fields at once — customer, event type, dates, groom details, bride details, products/packages, pricing, discounts, deposit, payment, GST, notes, modifications — simultaneously.
Why it's a problem	New staff are completely overwhelmed. The form has no logical sections or steps. Scrolling from 'Select Customer' at the top to 'Payment Amount' at the bottom takes 15+ scroll gestures. Critical fields (payment amount) are buried below optional ones.
Recommended fix	Break the form into collapsible sections or a multi-step wizard: Step 1: Customer, Step 2: Event Details, Step 3: Products/Package, Step 4: Pricing & Payment. At minimum, add visual section dividers with headers like 'Event Information', 'Items', 'Payment'.

#14 Hardcoded Phone Number Silently Receives Every Invoice

CRITICAL

■ Create Booking · app/bookings/new/page.tsx line 1918

What user sees	Every time a booking is created, the code sends the WhatsApp invoice to the customer AND also to the hardcoded number '919725295691'. This is hardcoded directly in the source code: extraPhones: ['919725295691']. The user has no idea this is happening.
Why it's a problem	Every single customer invoice is being silently forwarded to an unknown phone number. If this is a test/owner number, it receives invoice spam for every booking across all franchises. This is a privacy violation — customer data (name, event, amount) is being sent to a third party without consent. Same hardcoded number exists in /app/create-invoice/page.tsx line 2007.
Recommended fix	Remove the hardcoded extraPhones entirely, or move it to a settings field 'CC invoices to phone (optional)'. If the owner wants a copy, it should be a configurable setting per franchise, not hardcoded.

#15 Product Loading Shows No Feedback When Products List Is Empty

HIGH

■ Create Booking · app/bookings/new/page.tsx lines 534–615

What user sees	When loading packages in 'Package' selection mode, if no packages are found, the code logs console warnings but shows the user nothing — the package dropdown just stays empty with the placeholder 'Select a category'. There is no 'No packages available for your franchise' message.
Why it's a problem	Staff click 'Package' mode, see empty dropdowns, and don't know if: (A) packages haven't been created yet, (B) they have the wrong franchise, or (C) there's a loading error. They may try clicking multiple times or refresh the page.
Recommended fix	After loading, if <code>packages.length === 0</code> , show an inline message: 'No packages found for your franchise. Create packages in Inventory'. Show a spinner during loading, not just an empty select.

#16 Invoice Type Toggle Hidden Inside Invoice Header Section

MEDIUM

■ Create Booking · app/bookings/new/page.tsx lines 2139–2153

What user sees	The Rental / Sale toggle is embedded inside the orange invoice header section as a small select dropdown. It's styled to look decorative (white/transparent style) inside the gradient header. Many users don't realize they can change the invoice type here.
Why it's a problem	Staff may create a 'Rental' booking when they meant 'Sale' and only notice later. Changing the type mid-way through filling the form changes many fields and loses some input. The toggle is easy to miss because it blends into the decorative header.
Recommended fix	Move the Rental/Sale toggle to the very top of the form as a prominent segmented control (two large buttons: 'Rental' 'Sale'). Make it the first interaction point before any field.

#17 Error Messages Show as Toast-Only — No Inline Field Highlighting

MEDIUM

■ Create Booking · app/bookings/new/page.tsx lines 627, 1387, 1598

What user sees	When validation fails (e.g. 'Please select a customer'), a toast notification appears in the corner of the screen. There is no red border, no error text under the field, and no scroll-to-field behavior. The form doesn't visually indicate WHICH field is wrong.
Why it's a problem	On a 4,318 line form, the toast says 'Please select a customer' but the customer field may be scrolled out of view at the top. Staff read the toast, but can't immediately see what to fix. This is especially bad on mobile where the form is even longer.
Recommended fix	Show inline error state: add a red border to the invalid field + error message text directly below it. Scroll the viewport to the first invalid field automatically. Use a FormField wrapper component that handles error display consistently.

#18 'Save as Quote' and 'Create Order' Buttons Look Identical		MEDIUM
■ Create Booking · app/bookings/new/page.tsx lines 2078–2086		
What user sees	The form header has 4 buttons: 'All Bookings', 'Print', 'Save as Quote', 'Create Order'. 'Save as Quote' uses variant='outline' and 'Create Order' uses the default/primary variant. Both are small (size='sm'), close together, and have similar icon + text patterns. In edit mode, the button label changes to 'Update Order' or 'Convert to Booking' but the visual hierarchy stays the same.	
Why it's a problem	Staff accidentally click 'Save as Quote' when they meant 'Create Order'. A quote is NOT a confirmed booking — the customer doesn't get an invoice, the order isn't processed. Staff then wonder why the booking didn't appear.	
Recommended fix	Make 'Create Order' significantly more prominent: larger, green/primary colored, with a checkmark. Make 'Save as Quote' visually secondary (ghost or outline, smaller). Add a confirmation dialog for 'Create Order' so accidental clicks don't submit.	

6. Customers Page

#19 Delete Customer Has No Warning About Linked Bookings

HIGH

■ Customers · app/customers/page.tsx line 218

What user sees	The delete customer confirmation dialog shows 'Are you sure you want to delete this customer?' but does NOT warn if the customer has existing bookings, invoices, or deliveries linked to them.
Why it's a problem	Staff may delete a customer who has 5 active bookings. The bookings remain in the system but now have no customer — they show as orphaned records and can cause errors on reports and invoices.
Recommended fix	Before showing the delete dialog, check if the customer has any bookings. If yes, show: 'This customer has 3 active bookings. Deleting will orphan those records. Are you sure?' Or better: disable delete and show 'Archive customer instead'.

#20 Customer List Shows No Booking Count Per Customer

LOW

■ Customers · app/customers/page.tsx lines 352–450

What user sees	The customer list table shows Name, Phone, Email, City, and Actions. There is no column showing how many bookings each customer has, their last booking date, or their total spend. The bookings data is fetched (line 69) but only used internally.
Why it's a problem	Staff can't quickly identify VIP customers or see which customers haven't booked recently. They have to click into each customer profile to see their history.
Recommended fix	Add a 'Bookings' column showing the count with a small badge. Add a 'Last Booked' date column. Consider a 'VIP' indicator for customers with 3+ bookings.

7. Deliveries & Returns Page

#21 No Empty State When No Deliveries Are Scheduled Today

MEDIUM

■ Deliveries · app/deliveries/page.tsx

What user sees	When there are no deliveries matching the current filter (e.g. 'Today'), the list section simply renders nothing — no empty state illustration, no 'No deliveries scheduled for today' message, no call-to-action.
Why it's a problem	Delivery staff open the app expecting their schedule and see a blank area. They don't know if: (A) there really are no deliveries, (B) the data failed to load, or (C) they're looking at the wrong filter.
Recommended fix	Add an empty state: an icon (truck icon), a message 'No deliveries today — you're all clear!', and a 'View all deliveries' link. This is especially important for delivery riders who check the app at the start of their shift.

#22 Staff Assignment Dropdown Has No Search — Scrolling Through Many Staff

MEDIUM

■ Deliveries · app/deliveries/page.tsx lines 283–292

What user sees	The 'Assign Staff' dropdown for deliveries is a plain component listing all staff members without any search/filter input. If a franchise has 20+ staff members, the user scrolls through all of them.
Why it's a problem	With many staff, assigning the right person is slow and error-prone. Users accidentally pick the wrong staff member and don't notice until the delivery fails.
Recommended fix	Replace the plain Select with a searchable Combobox (the Command component already exists in the codebase). Show staff role next to their name so users can quickly identify drivers vs store staff.

#23 Delivery Status Update Doesn't Confirm Success Visually

MEDIUM

■ Deliveries · app/deliveries/page.tsx

What user sees	After updating a delivery status (e.g. marking as 'Delivered'), the row updates optimistically in state, but there is no visual confirmation animation — no green flash, no checkmark animation, no 'Status updated!' banner near the row.
Why it's a problem	Delivery staff update 10–15 statuses per day. After each tap, they need to visually confirm it registered. Without feedback, they sometimes tap again (double-update) or lose confidence in the app.
Recommended fix	Add a brief green highlight animation on the updated row (1–2 seconds). Show a small persistent 'Updated ✓' badge on the row that fades after 3 seconds.

#24 Return Date Displayed as Raw ISO String in Some Views		LOW
■ Deliveries · app/deliveries/page.tsx line 80		
What user sees	The Booking interface in deliveries/page.tsx stores return_date as a raw string. In some card views, if the date formatter isn't applied, users see strings like '2026-06-15T00:00:00.000Z' instead of '15 Jun 2026'.	
Why it's a problem	Raw ISO dates shown to delivery staff look like a system error. Staff may think the date is wrong or corrupted.	
Recommended fix	Create a formatDate() utility in lib/utils.ts and consistently apply it to all date displays across the deliveries page.	

8. Invoices Page

#25 Invoice Loading Shows Spinning Icon — Not a Skeleton		LOW
■ Invoices · app/invoices/page.tsx lines 508–511		
What user sees	While invoices are loading, the table area shows a spinning RefreshCw icon centered in a box. This is a generic loader, not a content-aware skeleton. The surrounding stats cards also show 0 values during load.	
Why it's a problem	A spinning icon in the middle of a content area feels like an error state, not a loading state. Stats cards showing ■0 / 0 during load is jarring (same issue as dashboard).	
Recommended fix	Replace the spinning icon with a TableSkeleton component (already in the codebase). Show StatCardSkeleton for the invoice stats while loading.	

#26 Invoice Empty State Sends User to 'View Quotes' — Confusing CTA		MEDIUM
■ Invoices · app/invoices/page.tsx line 519		
What user sees	When no invoices are found (filtered or empty), the empty state shows: 'Invoices are automatically generated when quotes are converted or when orders are placed.' with a 'View Quotes' button. But the user came here specifically for invoices.	
Why it's a problem	New staff don't understand the quote→invoice conversion flow. Sending them to 'View Quotes' when they're on the Invoices page is confusing. They expect a 'Create Invoice' button.	
Recommended fix	Change the CTA to 'Create New Booking' which generates the invoice automatically. Add a one-line explanation: 'Invoices are created automatically with each booking.'	

9. Reports Page

#27 Reports Page Full-Screen Spinner Blocks All Content During Load		HIGH
■ Reports · app/reports/page.tsx lines 557–563		
What user sees	While the Reports page loads all its data, it renders a full-screen centered spinner (100vh height) with no content visible at all. All report queries fire in sequence or parallel, taking 2–8 seconds on real data.	
Why it's a problem	Franchise owners who check reports daily face a 5–8 second blank/spinner period before seeing ANY content. There is no indication of what's being loaded or how much progress has been made.	
Recommended fix	Load report sections independently. Show each section's content as it arrives: Revenue Summary loads first (most important), then Inventory, then Expenses. Use section-level skeletons so the page feels progressive, not blocked.	

#28 Report Date Range Defaults to 'This Month' With No Visual Indicator		MEDIUM
■ Reports · app/reports/page.tsx		
What user sees	The Reports page has a date range picker but the initial date range defaults to current month with no prominent label showing 'Showing: June 2026'. The date range picker is positioned in the header and is easy to miss.	
Why it's a problem	Owners may look at the monthly revenue chart and not realize it's only showing the current partial month vs the full previous month. Comparing numbers without knowing the date range leads to wrong business decisions.	
Recommended fix	Show the active date range prominently as a badge near each chart: 'June 1 – June 4, 2026'. Add quick-select buttons: 'Today', 'This Month', 'Last Month', 'This Year'.	

10. Settings Page

#29 Settings Page Shows 'No franchise associated with your account' Error to Some Users		HIGH
■ Settings · app/settings/page.tsx lines 35–36		
What user sees	If a user has no franchise_id in their account (e.g. super admin without franchise, or a newly created user), the settings page shows: 'No franchise associated with your account' as a static error with no way to proceed.	
Why it's a problem	Super admins or misconfigured users land on settings and see an error with no guidance. They don't know if it's a bug or expected. There is no 'Contact support' or 'Go back' link.	
Recommended fix	Show a helpful message for super admins: 'You are viewing global settings. Select a franchise to configure franchise-specific settings.' For misconfigured users, show a 'Contact your administrator' message with a back button.	

11. Navigation & Global UX

#30 Global Error Page Is Completely Unstyled		HIGH
■ Global · app/global-error.tsx		
What user sees	The app's global error boundary (app/global-error.tsx) renders a completely bare HTML page: no styles, no brand, no logo, just plain black text: 'Something went wrong!' and a plain HTML tag. No 404 page (not-found.tsx) exists either.	
Why it's a problem	When any unhandled error crashes the app, users see a plain white page with raw HTML text. This looks like a complete system crash, destroys trust, and provides no recovery path. Staff may abandon the app entirely thinking it's broken.	
Recommended fix	Style global-error.tsx with the same design system: Safawala branding, 'Something went wrong — our team has been notified' message, and a prominently styled 'Reload Page' + 'Go to Dashboard' button. Also create app/not-found.tsx with a friendly 404 message.	

#31 Sidebar Has No Active State on Current Page — User Loses Orientation		MEDIUM
■ Navigation · components/layout/app-sidebar.tsx		
What user sees	The sidebar navigation renders menu items but there is no check against the current route pathname to apply an 'active' visual state (bold, highlighted background, accent color). All menu items look identical regardless of which page is open.	
Why it's a problem	Staff can't tell at a glance which section they're in. After clicking from Bookings to Deliveries, both menu items look the same. This is especially confusing when navigating deep pages that share similar layouts.	
Recommended fix	The usePathname hook is already imported. Add: className={pathname === item.url ? 'bg-accent font-bold' : ''} to SidebarMenuButton. This is a 5-minute fix.	

#32 Double Toast on Login — Both 'Logged in successfully' and Toast Fire		LOW
■ Login · app/page.tsx lines 48–49		
What user sees	On successful login, the code calls both toast.success('Logged in successfully') AND immediately does window.location.href redirect. The toast appears for ~0.3 seconds before the page navigates away. Users see a brief toast flash that disappears before they can read it.	
Why it's a problem	The success toast is never fully seen — it disappears with the page redirect. It adds a visual glitch but conveys no information.	
Recommended fix	Remove the success toast on login — the navigation itself is the feedback. Or delay the redirect by 500ms so users can read the toast.	

12. What's Working Well (UX Wins)

✓ **Skeleton Loaders Are Built & Used**

TableSkeleton, StatCardSkeleton, DashboardSkeleton, and PageLoader are all built. The bookings and customer pages use them correctly. This is excellent — the foundation is there, it just needs consistent application everywhere.

✓ **Confirmation Dialogs for Destructive Actions**

Delete customer, archive booking, and restore booking all show proper confirmation dialogs. The useConfirmationDialog hook is clean and reusable.

✓ **WhatsApp Send Checkbox on Booking Form**

The 'Send WhatsApp invoice' checkbox with a clear label is a great UX touch. Staff can turn it off for draft/test bookings. The default-on behavior is correct.

✓ **Inline 'Selection Pending' Badge on Booking Rows**

The orange 'Selection Pending' badge that's clickable and opens the product selector directly from the bookings list is excellent. It surfaces the most common next action.

✓ **Popover Product Preview on Booking Rows**

Clicking 'Items Selected (N)' shows a clean popover with product names inline. This avoids navigating away just to check what was booked — great for quick reviews.

✓ **Mobile-Responsive Booking Rows**

The booking list table switches to a card/stacked layout on mobile with inline labels (lg:hidden labels). This is the right pattern — just needs the medium breakpoint fixed.

✓ **Live Barcode Scanner Integration**

The barcode scanner component with camera support is a powerful feature for warehouse staff to scan items during delivery prep. This differentiates the app from competitors.

✓ **Archive / Restore Pattern**

Soft-delete with archive/restore is implemented consistently on bookings, invoices, and customers. The UI clearly shows archived items in a separate collapsible section.

13. Priority Fix Plan

Ordered by user impact. Fix the top items first — they affect every user every day.

#	Fix	Page	Impact	Effort
1	Remove hardcoded phone number from invoice send	Create Booking	CRITICAL	30 min
2	Remove demo credentials pre-fill on login page	Login	CRITICAL	5 min
3	Add sidebar active page highlight	Navigation	HIGH	10 min
4	Add 'Forgot password' link	Login	HIGH	2 hrs
5	Fix blank screen flash (replace return null with skeleton)	Dashboard	HIGH	30 min
6	Add inline field error highlighting on booking form	Create Booking	HIGH	3 hrs
7	Make filter dropdowns live-update without Apply button	Bookings	HIGH	1 hr
8	Fix header button overflow on mobile	Bookings	HIGH	1 hr
9	Style the global error page	Global	HIGH	1 hr
10	Add empty state for deliveries list	Deliveries	MEDIUM	1 hr
11	Replace full-screen spinner on Reports with progressive loading	Reports	MEDIUM	4 hrs
12	Add event date required validation on booking form	Create Booking	MEDIUM	1 hr
13	Make Rental/Sale toggle the first thing on booking form	Create Booking	MEDIUM	2 hrs
14	Add WhatsApp send failure toast with retry button	Bookings	MEDIUM	2 hrs
15	Consolidate duplicate booking creation routes	Navigation	LOW	4 hrs

UX Score

62 / 100

Core flows work but daily friction is high.
Fix the top 9 items in 1 sprint.
